1. Numbers

1.1 Number Systems

Definition 1.1.1 – Natural Numbers.

$$\mathbb{N} = \{0, 1, 2, 3, \dots\}$$

-  It is not uncommon for zero to be excluded from the natural numbers. In fact, some exclude zero from the natural numbers and then describe the set of natural numbers that include zero the whole numbers.

$$\mathbb{W} = \{0, 1, 2, 3, \dots\}$$

For the purposes of these notes, zero will be included within the set of natural numbers.

Definition 1.1.2 – Integers.

$$\mathbb{Z} = \{\dots, -3, -2, -1, 0, 1, 2, 3, \dots\}$$

Definition 1.1.3 – Positive Integers.

$$\mathbb{Z}^+ = \{1, 2, 3, \dots\}$$

Definition 1.1.4 – Rational Numbers.

$$\mathbb{Q} = \{m/n \mid m, n \in \mathbb{Z}, n \neq 0\}$$

Definition 1.1.5 – Proper Fraction. Given $m < n$, then the fraction m/n is called **proper**.

Definition 1.1.6 – Improper Fraction. Given $m > n$, then the fraction m/n is called **improper**.

1.2 Prime Numbers

Definition 1.2.1 – Greatest Common Divisor. Suppose that m and n are positive integers. The greatest common divisor is the largest divisor (factor) common to both m and n .

Definition 1.2.2 – Relatively Prime. Two integers m and n are relatively prime to each other, $m \perp n$, if they share no common positive integer divisors (factors) except 1.

$$m \perp n \text{ if } \gcd(m, n) = 1.$$

3.1 Negation Notation

Notation 3.1.1 – Operation of Negation (ONeg).

$$\neg a = \neg a \quad (3.1a)$$

$$\neg a = -a \quad (3.1b)$$

I have used a different symbol, \neg , as the prefix negation operator only to differentiate it from the minus sign infix operator symbol, $-$, which is also used as the infix operator for the dyadic operation of subtraction. I will refer to this change of symbol as ONeg. This is used only as a teaching tool and should not be confused with the logic negation operator. Another advantage of using this symbol is that it reduces the number of delimiters used in an expression for example, $\neg a$ versus $(-a)$.

- Negative five: -5
- Negative five: $\neg 5$
- Four minus five: $4 - 5$
- Four minus negative five: $4 - \neg 5$
- Four minus negative five: $4 - (-5)$
- Four minus negative five: $4 - \neg 5$
- Negative four minus five: $-4 - 5$
- Negative four minus five: $\neg 4 - 5$

8. Simplifying Univariate Polynomials

The definition of a univariate polynomial expression is based on the expanded canonical form of some polynomial expression. It might be that the original expression might not be in the expanded canonical form, so a process called **simplifying by expanding** will be introduced to manipulate the expression such that it can be written in its expanded canonical form.

This process of simplifying by expanding polynomial expressions will be developed to the extent that it will be used to simplify multivariate polynomials. We will start by simplifying univariate monomial expressions.

8.1 Simplifying Degree 0 Univariate Monomials

Definition 8.1.1 – Indeterminate.

x

An indeterminate is a symbol that is treated as a variable, but does not stand for anything else but itself and is used as a placeholder.

- it does **not** designate a constant or a parameter
- it is **not** an unknown that could be solved for
- it is **not** a variable designating a function argument

[2]

Definition 8.1.2 – Degree of the Indeterminate.

x^k

The exponent of an indeterminate power, k is called the degree of the indeterminate.

Polynomial [4]

Definition 8.1.3 – Coefficient.

Cx^k

A coefficient, C is a real number multiplicative factor.

Definition 8.1.4 – Univariate Monomial.

$C_k x^k$

A univariate monomial is made up of two factors. The first factor of a monomial, C_k , is the **coefficient**. The second factor of each monomial, x^k , is an indeterminate raised to a non-negative integer power k .

Degree 0 univariate polynomial expressions are made up of univariate monomials, C_0 , called **constants**. The power identity is an indeterminate raised to a power of 0 has a value of 1. Thus, $x^0 = 1$ and results in the monomial $C_0 \cdot 1$. The canonical form of a product does not show the multiplicative identity factor, so what remains of this monomial product is only the coefficient factor C_0 and from now on will be referred to as a **constant**.

Degree 0 univariate polynomial expressions are usually a monomial in their canonical form if C_0 is a non-zero real number. The exception is if $C_0 = 0$, the additive identity, then the result is the zero polynomial, which can be considered a degree -1 polynomial.

The expression can be manipulated into its monomial canonical form by simplifying the expression. Simplifying the expression can be defined as evaluating the expression by following order of operations, which is the same as evaluating an arithmetic expression.

Definition 8.1.5 – Univariate Like Terms.

$$C_1x^k = C_2x^k$$

Two or more univariate monomials are defined as having like terms if each monomial has the same term, which will be the same indeterminate raised to the same positive integer power.

Sometimes the word **term** is used to describe monomials (including both the coefficient and the term), which may be confusing when trying to define like terms. For this reason, we will refer to the summands of a polynomial as monomials.

The monomials $5x^1$ and $3x^1$ can be described as having like terms because they share the common term x^1 . One could also say that $5x^1$ and $3x^1$ are like terms by definition and consequently giving the reader an impression that $5x^1$ and $3x^1$ are terms themselves.

A degree 1 indeterminate does not display the multiplicative identity in the exponent when its in canonical form.

Example 8.1 – id:20141121-093747.

Express $13x^0$ in canonical form.

Solution:

8.2 Simplifying Degree 1 Univariate Monomials

Example 8.2 – id:20141120-202042.

Express $5x^1$ in canonical form

(S) _____

Solution:

$$5x \quad \text{MId}(4.9b)$$

■

Example 8.3 – id:20141121-093439.

Express $7x^1 + 5$ in canonical form.

(S) _____

Solution:

$$7x + 5 \quad \text{MId}(4.9b)$$

■

If the constant monomial is 0, the additive identity, then the canonical form of a degree 1 univariate polynomial is a degree 1 monomial.

Example 8.4 – id:20141120-203846.

Simplify by expanding $6x + 7x$

(S) _____

Solution:

Notice that the indeterminate of each monomial is of degree 1; however, the exponent 1 is not shown. The monomials $6x$ and $7x$ have a like term of x .

$$\begin{array}{ll} (6 + 7)x & \text{DPF}(4.3a) \\ 13x & \text{OOA}(2.1) \end{array}$$

Notice that the sum of two monomials that have like terms can be found by adding the coefficients of the monomials. The distributive property in the factoring direction provides some insight to why we can add the coefficients of monomials that have like terms.

S**Less Steps Solution:**

$$13x \quad \text{OOA(2.1)}$$

■

Example 8.5 – id:20141027-075159.Simplify by expanding $7 \text{ cm} + 8 \text{ cm}$ **S****Solution:**

$$(7 + 8) \text{ cm} \quad \text{DPF(4.3a)}$$

$$15 \text{ cm} \quad \text{OOA(2.1)}$$

■

R

Remember, if a monomial does not have a coefficient factor, then it's implied that the coefficient factor is 1, the multiplicative identity, and consequently its not explicitly shown.

Example 8.6 – id:20141121-185558.Simplify by expanding $x + 5x$ **S****Solution:**

It can be useful when simplifying expressions to make the multiplicative identity (MId) factor explicit.

$$\begin{array}{ll} 1x + 5x & \text{MId(4.9a)} \\ (1 + 5)x & \text{DPF(4.3a)} \\ 6x & \text{OOA(2.1)} \end{array}$$

S**Less Steps Solution:**

$$\begin{array}{ll} 1x + 5x & \text{MId(4.9a)} \\ 6x & \text{OOA(2.1)} \end{array}$$

As one becomes more experienced, there is no reason to make the multiplicative identity coefficient explicit.

8.8 Simplifying Degree n Univariate Polynomials

Definition 8.8.1 – Univariate Polynomial Expression.

$$\sum_{k=0}^n C_k x^n = C_n x^n + C_{n-1} x^{n-1} + \cdots + C_k x^k + \cdots + C_2 x^2 + C_1 x^1 + \underbrace{C_0}_{C_0 x^0} \quad (8.1)$$

A univariate polynomial in an indeterminate x is an expression made up of one or more summands of the form $C_k x^k$, which are called monomials. The first factor of each monomial, C_k , is a numerical factor called the **coefficient** where $C_k \in$. The second factor

of each monomial, x^k , is an indeterminate raised to a non-negative integer power i .

Polynomial [4]

Definition 8.8.2 – Degree of the Univariate Polynomial.

$$C_n x^n + C_{n-1} x^{n-1} + \cdots + C_k x^k + \cdots + C_2 x^2 + C_1 x^1 + \underbrace{C_0}_{C_0 x^0}$$

The degree of the univariate polynomial is determined by the monomial with the largest degree of the indeterminate.

Definition 9.0.3 – Zero Polynomial. A constant polynomial with a value of zero whose coefficients are all equal to zero is called a zero polynomial. The zero polynomial, 0, can be classified as a degree -1 polynomial. The zero polynomial is the additive identity, AId (4.4a), for polynomials.

12.2 Completing The Square

Completing the square is an algebraic process used to find the roots of quadratic equations of the form, $ax^2 + bx + c = 0$. Essentially, we want to manipulate this equation such that $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$.

Proof. Let's begin with a quadratic equation in the general form: $ax^2 + bx + c = 0$. Since we are trying to manipulate the equation $ax^2 + bx + c = 0$ such that $x = \text{some value(s)}$, we first want the coefficient factor a to be equal to 1.

$$\begin{aligned} \frac{1}{a} [ax^2 + bx + c] &= \frac{1}{a} [0] && \text{SPE(4.15) + MI(4.10a)} \\ \frac{1}{a} \cdot ax^2 + \frac{1}{a} \cdot bx + \frac{1}{a} \cdot c &= \frac{1}{a} [0] && \text{DPE(4.8a)} \\ \frac{1}{a} \cdot a \cdot x^2 + \frac{1}{a} \cdot b \cdot x + \frac{1}{a} \cdot c &= \frac{1}{a} [0] && \text{JTC(3.5)} \\ x^2 + \frac{b}{a} \cdot x + \frac{c}{a} &= 0 && \text{OOM(2.3)} \\ x^2 + \frac{b}{a} x + \frac{c}{a} &= 0 && \text{CTJ(3.6)} \end{aligned}$$

We now have three summands in the left hand expression where the first two summands have x^2 and x terms respectively. The goal is to have $x = \text{some value}$, so the next step is focused on removing the $\frac{c}{a}$ summand.

$$\begin{aligned} \left[x^2 + \frac{b}{a} x + \frac{c}{a} \right] + -\frac{c}{a} &= [0] + -\frac{c}{a} && \text{SPE(4.15) + AI(4.5a)} \\ x^2 + \frac{b}{a} x + \left(\frac{c}{a} + -\frac{c}{a} \right) &= 0 + -\frac{c}{a} && \text{APA(4.2a)} \\ x^2 + \frac{b}{a} x + 0 &= -\frac{c}{a} && \text{OOA(2.1)} \\ x^2 + \frac{b}{a} x &= -\frac{c}{a} && \text{AIId(4.4b)} \end{aligned}$$

The next step is called completing the square - the creative step. The idea is to add a *New* constant, k , to the left-hand expression, $x^2 + \frac{b}{a}x + k$, such that the quadratic expression can then be factored as two identical factors, $(x + m)(x + m) = (x + m)^2$, where $k = m \cdot m$.

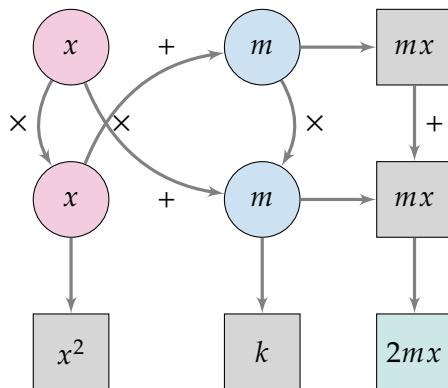

Figure 12.1: The Organization of the Distributive Property

Adding k to the right-hand expression is a consequence of adding k to the left-hand expression to get what we want (a perfect square), $[x^2 + \frac{b}{a}x] + k = [-\frac{c}{a}] + k$.

To determine the values of both m and k we should refer to the the organisation of the two factors, $(x + m)^2$, that make up the product of the quadratic expression, $x^2 + \frac{b}{a}x + k$.

Since both factors of this new quadratic expression are the same, both terms that make up the middle term, must also be the same. We know that $mx + mx = \frac{b}{a}x$, so we should be able to determine the value of m from this equation. If we can determine the value of m , then we can determine the value of k .

$$\begin{aligned}\frac{b}{a}x &= mx + mx \\ &= 2mx\end{aligned}\quad \text{OOA(2.1)}$$

Solving for m ,

The previous proof starts with choosing to multiply both expressions by the multiplicative inverse of the coefficient of the degree two term such that ax^2 becomes x^2 . It is easier to manually complete the square, guess the two binomial factors, when the coefficient of the degree 2 term is 1. However, as a consequence, the coefficients of the degree one and degree zero terms become fractions $\frac{b}{a}$ and $\frac{c}{a}$ respectively. All that it means is that we have to work with fractions throughout the procedure.

Proof.

14. Derivative by First Principles

14.1 Limit of the Difference Quotient

Definition 14.1.1 – Derivative. The derivative of a function $f(x)$ with respect to the variable x is defined as

$$f'(x) \equiv \lim_{\Delta x \rightarrow 0} \underbrace{\frac{f(x + \Delta x) - f(x)}{\Delta x}}_{\text{Difference Quotient}} \quad (14.1)$$

Example 15.13 – id:20141128-155506.

Differentiate $y = \ln(\cos x)$

(S)

Solution: After identifying that $y = \ln(\cos x)$ is a composite function, we let $u = \cos x$ and thus we get a new function $y = \ln(u)$.

Using chain rule,

$$\frac{dy}{du} = \frac{1}{u} \quad \frac{du}{dx} = -\sin x$$

16. Equations of Tangent & Secant Lines

16.1 Essential Questions

Essential Questions 16.1

1. How do we find the equation of the tangent line of a given function at the point $P(a, b)$?
2. How do we find the equation of the tangent line of a given function at $x = a$?

16.2 Finding the Equation of the Tangent Line

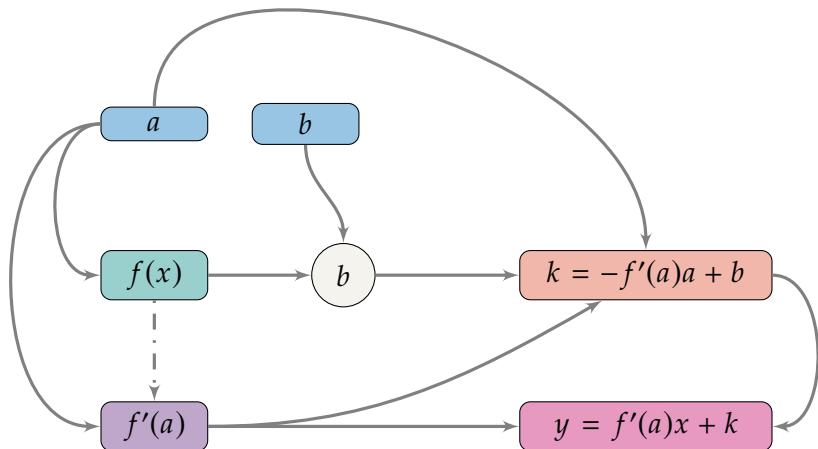

Figure 16.1: Finding the Equation of a Tangent Line Workflow

For a given function, $f(x)$, our goal is to find the equation of the tangent line at the point $P(a, b)$, which can be expressed in slope-intercept form as:

$$y = f'(a)x + k$$

Where $f'(a)$ is the value of the derivative, slope, at $x = a$ and k is the y -intercept. We therefore need to:

1. Find the derivative of the function $f(x)$: $f'(x)$
2. Find the value of the derivative at $x = a$: $f'(a)$
3. Find the value of the y -intercept: $k = -f'(a) + b$:
4. If the ordinate b is not explicitly given, then find $f(a) = b$

Example 16.1 – id:20151011-154209.

Find the equation of the line tangent to the curve of the function $f(x) = 2x^2 + 3x + 7$ at the point $P(2, 21)$.

(S) _____

Solution:

$$f'(2) = 8 + 3 \quad \text{OOM(2.3)}$$

$$f'(2) = 11 \quad \text{OOA(2.1)}$$

Find the y -intercept, k , of the equation of the tangent line.

$$y = f'(x)x + k$$

$$[21] = [11][2] + k \quad \text{SPE(4.15)}$$

$$21 = 22 + k \quad \text{OOM(2.3)}$$

$$\neg 22 + [21] = \neg 22 + [22 + k] \quad \text{SPE+AI}$$

$$\neg 22 + 21 = (\neg 22 + 22) + k \quad \text{APA(4.2a)}$$

$$\neg 1 = k \quad \text{ONeg(3.1b)}$$

$$k = -1 \quad \text{SyPE(4.16a)}$$

The equation of the tangent line is

$$\begin{aligned}
 y &= f'(x)x + k \\

17. First Derivative Test

Example 17.1 – id:20151012-190708.

Given the function $f(x) = 2x^3 - 3x^2 - 12x + 1$ find the critical points, classify the critical points and find the intervals of increasing/decreasing.

(S)

Solution:

Differentiate the function:

$$f(x) = 2x^3 - 3x^2 - 12x + 1 \quad \text{DOS(4.12a)}$$

$$[f(x)]' = [2x^3 + -3x^2 + -12x + 1]' \quad \text{SPE(4.15)}$$

$$f'(x) = [2x^3]' + [-3x^2]' + [-12x]' + [1]' \quad \text{DS(7.7)}$$

$$f'(x) = 2[x^3]' + -3[x^2]' + -12[x]' + [1]' \quad \text{DCM(7.3)}$$

$$f'(x) = 2(3x^2) + -3(2x) + -12(1) + [1]' \quad \text{DPo(7.5)}$$

$$f'(x) = 6x^2 + -6x + -12 + [1]' \quad \text{OOM(2.3)}$$

$$f'(x) = 6x^2 + -6x + -12 + 0 \quad \text{DC(7.1)}$$

$$f'(x) = 6x^2 + -6x + -12 \quad \text{AId(4.4a)}$$

Solving the equation $6x^2 + -6x + -12 = 0$ to find the x value(s) of the critical points, goto 12.2, we find that $x = 2$ and $x = -1$ are critical values of the function.

Since we are looking for critical **points**, we need to find the ordinates, y -values, of the critical points by evaluating the function for the given critical x -values.

$$f(2) = -19 \text{ goto 13.1}$$

$$f(-1) = 8 \text{ goto 13.2}$$

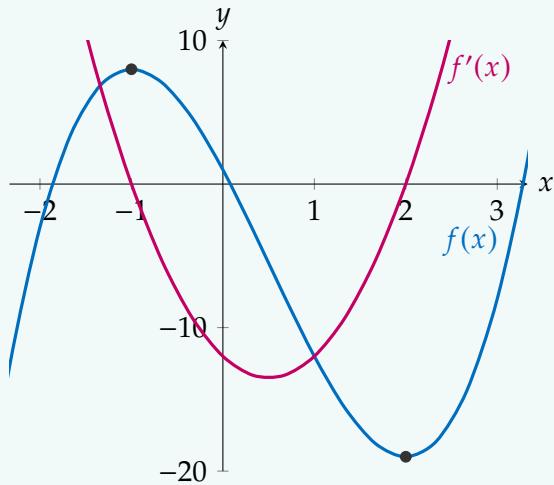

Therefore the critical points are $(2, -19)$ and $(-1, 8)$.

The first derivative test can be used to determine the intervals of increasing/decreasing and consequently we will be able to classify the critical points. Since we are only interested in the values of the derivative, it will be easier to use the factored form of the derivative, $f'(x)=6(x-2)(x+1)$

1st Derivative Test Table

x	$x < -1$	$x = -1$	$-1 < x < 2$	$x = 2$	$x > 2$
$f'(x)$	+	0	-	0	+
$f(x)$	↗	→	↘	→	↗
C.P.		Max		Min	

From the first derivative table we can classify the critical point $(2, -19)$ as a local maximum and $(-1, 8)$ as a local minimum.

18. Curve Sketching

18.0.1 Finding the vertex of a quadratic function using differentiation.

We can find the vertex of a quadratic function, $f(x)$ using differentiation by:

1. Differentiate the function: Find $f'(x)$.
2. Set the derivative equal to zero: $f'(x) = 0$.
3. Find the abscissa of the vertex by solving the equation $f'(x) = 0$ for x to find the critical x value: $x = k$.
4. Find the ordinate of the vertex by substituting the value of critical value $x = k$ into the function $f(x)$: Evaluate $f(k)$

Example 18.1 – id:20151008-110208.

Find the vertex of the quadratic function, $f(x) = ax^2 + bx + c$, using differentiation.

(S)

Solution:

1. Find the derivative of $f(x)$

$$[f(x)]' = [ax^2 + bx + c]' \quad \text{SPE(4.15)}$$

$$f'(x) = [ax^2]' + [bx]' + [c]' \quad \text{DS(7.7)}$$

$$f'(x) = a[x^2]' + b[x]' + [c]' \quad \text{DCM(7.3)}$$

$$f'(x) = 2 \cdot a \cdot x + b \cdot 1 + [c]' \quad \text{DPo(7.5)}$$

$$f'(x) = 2 \cdot a \cdot x + 1 \cdot b + [c]' \quad \text{CPM(4.6)}$$

$$f'(x) = 2ax + 1b + [c]' \quad \text{CTJ(3.6)}$$

$$f'(x) = 2ax + b + [c]' \quad \text{MId(4.9b)}$$

$$f'(x) = 2ax + b + 0 \quad \text{DC(7.1)}$$

$$f'(x) = 2ax + b \quad \text{AId(4.4b)}$$

2. Set the derivative equal to zero and solve for x .

$$f'(x) = 0$$

$$2ax + b = 0$$

$$x = -\frac{b}{2a} \text{ goto 11.9}$$

The abscissa of the vertex is $x = -\frac{b}{2a}$.

3. Find the ordinate of the vertex by substituting the argument $x = -\frac{b}{2a}$ into $f(x)$

Example 18.2 – id:20150923-152515.

Find the vertex of the parabola $y = x^2 - 2x - 6$ using differentiation.

(S)

1. Differentiate the function.

$$f(x) = x^2 - 2x - 6$$

$$f(x) = x^2 + -2x + -6 \quad \text{DOS(4.12a)}$$

$$[f(x)]' = [x^2 + -2x + -6]' \quad \text{SPE(4.15)}$$

$$f'(x) = [x^2]' + [-2x]' + [-6]' \quad \text{DS(7.7)}$$

$$f'(x) = [x^2]' + -2[x]' + [-6]' \quad \text{DCM(7.3)}$$

$$f'(x) = 2x + -2 + [-6]' \quad \text{DPo(7.5)}$$

$$f'(x) = 2x + -2 + 0 \quad \text{DC(7.1)}$$

$$f'(x) = 2x + -2 \quad \text{AId(4.4b)}$$

$$f'(x) = 2x - 2 \quad \text{DOS(4.12b)}$$

- 2 and 3. Set the derivative equal to zero and solve for x

$$2x - 2 = 0$$

$$x = 1$$

4. Find the value of $f(1)$

$$f(x) = x^2 - 2x - 6$$

$$f(1) = [1]^2 - 2[1] - 6 \quad \text{SPE(4.15)}$$

$$f(1) = -7 \quad \text{Evaluate}$$

The vertex of this parabola is the point $(1, -7)$
